PROFESSIONAL SUMMARY

Software Engineer specializing in AI, Deep Learning, and Full Stack development (Python, JavaScript, React). Co-creator of the GIKI Bus Ticket Reservation System. Passionate about building scalable, intelligent software solutions that solve real-world problems.

EDUCATION

Ghulam Ishaq Khan Institute of Engineering Sciences and Technology

Topi, KPK

Bachelor of Computer Science | CGPA: 3.54

Sep. 2022 – May 2026

- **Relevant Coursework:** Data Structures and Algorithms, Object-Oriented Programming, Database Management Systems, DevOps, Artificial Intelligence, Operating Systems

EXPERIENCE

Skylabs.ai

Islamabad, Pakistan

LLM Intern

June 2025 – Present

- Reduced manual labor by 40% by designing and deploying autonomous AI agents to handle repetitive workflows.
- Improved model readiness through extensive data curation, including manual quality analysis, noise reduction, and preprocessing of raw data.
- Optimized synthetic data pipelines by reviewing and validating generation functions to guarantee high-quality output for model training.
- Engineered advanced system prompts using Chain-of-Thought (CoT) and few-shot techniques to optimize model reasoning and minimize hallucinations.

TECHNICAL PROJECTS

GIKI Transport System | React.js, Tailwind CSS, django, POSTGRESQL

[Live Preview](#)

- Deployed a campus-wide reservation platform that successfully replaced the legacy manual system, currently serving over **2,300+ students and employees**.
- Eliminated physical queuing and reduced booking time by designing a simple, user-friendly interface that allows for instant, hassle-free ticket reservations.
- Developed an interactive Admin Panel to digitize fleet management, allowing administrators to oversee schedules and availability in real-time.

RSS Feed Aggregator Platform | Golang, React.js, PostgreSQL, Goose

[GitHub](#)

- Engineered a high-performance content aggregator using **Golang** and **React**, creating a unified digital ecosystem for seamless consumption of diverse blog feeds.
- Leveraged **Goose** to architect an efficient RSS parsing engine, coupled with **PostgreSQL** to ensure reliable, structured persistence of high-volume feed content and user metadata.
- Empowered users to curate personalized knowledge streams through an intuitive dashboard featuring dynamic categorization and real-time search capabilities.

Trash Classification Using Support Vector Machines (SVM) | AI 351 Project, Machine Learning

[GitHub](#)

- Engineered an automated waste segregation pipeline using Support Vector Machines (SVM) to classify objects into six distinct categories, processing **2,500+** samples from the TrashNet dataset.
- Implemented Histogram of Oriented Gradients (HOG) for high-fidelity feature extraction, capturing complex edge directions and textural nuances to enhance structural recognition.
- Maximized model performance through exhaustive hyperparameter optimization (Grid Search), fine-tuning C and Gamma values to achieve a state-of-the-art accuracy of **98%**.

TECHNICAL SKILLS

Languages: JavaScript, Python, SQL, Golang

Frameworks & Libraries: React.js, Node.js, Express.js, Tailwind CSS, Goose, PyTorch, TensorFlow, OpenCV

Databases & Tools: PostgreSQL, Git, Postman
